

Typhoon OpenDSS Integration

Release Notes

V0.5.2

Compatible with Typhoon HIL Control Center 2026.3

- Improvements/bugfixes:
 - Generator pre-compiler fixed to properly refer to *basefreq* variable
 - Generator field voltage and mechanical torque inputs now use a delay to eliminate algebraic loops
 - Load component's mask updated to fix zero sequence removal in CPL mode.
 - Load component's internal Kalman filter updated to solve reference to non-existent variable problem
 - Fix for incorrect handling of the neutral connector automatic number setting:
 - For components with more than three phases, in which none of the terminals is labeled N. E.g., four-phase transmission line when terminal D is connected to a Bus Neutral.
 - For single phase components that are connected between a phase and neutral. E.g., single-phase load connected between a Bus' A and N terminals.
 - Transformers core coupling setting fixed to solve invalid reference to an internal property
 - Transmission lines parametrized to used couplings fixed to avoid evaluation error originated by incorrect conversion call to float. Moved from Numpy's *float64()* to Python's native *float()*
- Added examples:
 - Included set of unit test examples:
 - Generator component
 - With dynamic controls
 - With static controls
 - Interoperating with a converter
 - PV System
 - Three-winding transformer
 - VS Converter
 - External controls - consuming power
 - External controls - generating power
 - Internal controls

V0.5.1

Compatible with Typhoon HIL Control Center 2025.2

- Improvements/bugfixes:
 - Generator stability improvements and fixes to the incorrect power and voltage units in the mask description of the Generator Controller.
 - Load mask bugfixes in transition between load types.
 - Fixed Vsource container.
 - Updated handling of time series inputs on the SimDSS component.
 - Added property to change meter's snubbers on the Monitor component.
 - Co-simulation Widget Library Improvements.
 - PVSystem mask issue fixed.
 - Improvements on Examples documentation.
 - Temporary workaround on internal variable types of the VSource (due to the new numpy version used on THCC 2025.2)
- Added Examples:
 - EPC Power CHIL Interface using container component.
